## TRANGO Virtual Processors joins OMTP

TRANGO Virtual Processors, a leading provider of secure hypervisor for embedded markets, has announced today it has joined OMTP forum (<http://www.omtp.org>) to work with mobile operators and partners on terminal requirements specifications for next generation mobile.

Security threats on mobile devices are developing rapidly, as end-users expect more and more functionalities, connectivity and services from their mobile phone. MP3/movies delivery, TV broadcast or applications/games downloads increase hardware and software requirements on security mechanisms, in order to protect operators, service

providers and end-users confidential information from trojans, viruses and other malicious attacks.

TRANGO Virtual Processors will actively contribute to the definition of Trusted Processors and Trusted Environment specifications in OMTP forum. “TRANGO secure hypervisor is a key technology to improve mobile phone security and reduce bill of material. Hypervisors enable to integrate on single core platform both Open OS - like Linux, Windows Mobile or Symbian – and security stack. While integration enable to reduce number of processors and hardware cost, TRANGO hypervisor also isolate critical data and algorithms from malicious attack in and from Open OS. Some major mobile phone and semiconductor manufacturers are currently working with TRANGO to deploy secure hypervisor technology in their products for 2007.”, said Pierre Coulombeau, Chief Operating Officer of TRANGO Virtual Processors.

TRANGO hypervisor is available on ARM-, Xscale- and MIPS-based SOC, with customers and application cases in mobile phone, set-top box, residential gateways, point-of-sales terminal, and routers.

TRANGO Virtual Processors, a company of ELSYS Design group, is in the process of its first external funding round.
